

Data Modeling for Everyone

Data Modeling is about gathering, documenting, and communicating the elements and structure of business information. What begins as a conceptual interplay of logical data units, through the application of relational theory, becomes the basis for creating a physical database design. Data Modeling is a core skill for data professionals, and is a full time job for a small but growing number of IT practitioners. It is a crucial stage prior to good quality relational database design. Data Modeling for Everyone is for those who:

- Have no previous data modeling experience
- Want to understand the role of the data modeler in database design
- Need to know how to capture the essence of a system but don't know where to start
- Want more than just the theory and learn best from real world experience
- Require a book before other data design books helping you develop a logical model rather than assuming one exists that needs to be implemented in a database

Data Modeling for Everyone provides a solid foundation in the following tools & techniques:

- The different types of data modeling enterprise, transactional, and dimensional
- The stages of analysis developing conceptual, logical, and physical models
- What to do if you need to work with existing systems reverse engineering and forensic analysis
- General principles for converting logical models to physical ones
- Modeling scope focusing on what's important but allowing for future development of your model
- Defining detail entity relationship (E/R), key based, and fully attributed models
- Documenting your understanding of the business in the model
- Graphical data modeling, focusing on the IDEF1X notation
